

Git Instructions: Use one single repository for Final Term. Then make folders and put your tasks there.

For example, for your **PHP lab course**, one repository could look like:

```
PHP-Lab/
├── Week-01-Basics/
│   ├── task1.php
│   └── task2.php
├── Week-02-Variables/
│   ├── task1.php
│   └── task2.php
├── Week-03-If-Else/
│   ├── task1.php
│   └── task2.php
├── Week-04-Loops/
│   ├── task1.php
│   └── task2.php
├── Week-05-Switch-Case/
│   ├── task1.php
│   └── task2.php
├── Week-06-Combined-Task/
│   └── cafeteria.php
└── README.md
```

On GitHub

You can create the repository:

PHP-Lab

Then create folders such as:

```
PHP-Lab
├── Week-01
├── Week-02
├── Week-03
├── Week-04
└── Week-05
```

Each folder can contain its own .php files.

Important point

Git technically tracks **files**, not empty folders. So if you create an empty folder, Git won't normally include it. Once you put a file inside it, the folder appears in the repository.

For example:

```
mkdir Week-01
touch Week-01/task1.php
```

Then:

```
git add .
git commit -m "Add Week 1 PHP lab"
git push
```

The folder and its file will be uploaded.

You can also have separate projects

For example:

```
PHP-Lab/
├── Basic-PHP/
├── Student-Management/
├── Cafeteria-Billing/
└── Login-System/
```

└─ Final-Project/

All of these can be maintained under **one Git repository**.
